(54) Title: METHOD AND SYSTEM FOR AUDIOVISUAL REMOTE COLLABORATION

(57) Abstract: A method and system for real-time visualization of content from multiple locations simultaneously and/or consecutively. The content is covered with a transparent layer that can hold annotations linked to specific key points in the content, hence preserving its integrity. This is similar to a book with acetate transparencies covering each page, in which each transparency is associated with a given page and can hold annotations, drawings and edits, all without modifying the underlying text. The present invention achieves similar results by wrapping digital content in a transparent container. In addition to allowing annotations, this wrapper may enable real time visualization from remote locations. In accordance with a preferred embodiment, users may interact with content and with one another in real time, by using a standard web browser to log onto a web page containing a workspace that holds both the content and the annotations.
